

Supplementary information

Figure S1. GSK3 β gene expression in THC-treated melanoma cells. (A) The cells were treated with THC (0, 12.5, 25, 50 and 100 μ M) for 24 h and GSK3 gene expression was detected by Western blot analysis. (B) Quantification of band intensities. All data were reported as the mean ($\pm$ SEM) of at least three separate experiments. Statistical analysis was performed using a t-test.
