

Figure 2S. The content of free fatty acid - FFA (A), diacylglycerol - DAG (B), triacylglycerol - TAG (C), and phospholipid - PL (D), fractions in H9c2 cardiomyocytes after 18h incubation with palmitate (PA) in the concentration of 200 μ M 300 μ M. The data are expressed in nmol/mg of protein as mean values $\pm$ SD and are based on six independent determinations in each group. ^ap<0.05 indicates a significant difference between: the control group in comparison to the examined group.
