Tables and figures

Table 1.1 and Figure 1.1 describe the distribution of the healthcare markers used to identify the cohorts to create the cohorts.

Table S1 descriptive statistics of variables used to identify cohorts

Overall population (n=475371)					
Variable	Min	P25	P50 (median)	P75	Max
Unplanned hospital admission ¹	0	0	0	0	76
eFI ²	0	0	1	2	13
Polypharmacy ³	0	3	6	9	52

1 Defined by the number of unplanned hospital admissions (through accidents and emergency rooms or admitted patient care), identified in the linked HES data in 2009

2 Defined using the validated eFI score developed by Clegg et al(5). and currently used by the NHS to support routine frailty identification(8). The eFI was calculated based on a count of frailty markers/deficits as recorded during 2009 in CPRD using a pre-specified list of Read codes(5).

3 Defined by the number of different drug substances prescribed in 2009. For each patient, all prescriptions issued by GPs in 2009 were identified and for these prescriptions, the drug substance was retrieved using the "PRODUCT" dictionary and "THERAPY" table in CPRD. Fixed combinations of multiple substances in products were counted as one substance.

P25 and P75: 25th and 75th percentile. P50: median, eFI = electronic Frailty Index

Figure S1 Histograms of variables used to identify cohorts of complex health needs: (a) unplanned hospital admission, (b) eFI and (c) polypharmacy

One-month Point Prevalence
(a)

Three-month Point Prevalence
(b)

Figure S2 Point Prevalence for oral bisphosphonates, statins and anti-hypertensives, for all cohorts at (a) 1 month and (b) 3 months
