Clinical and MRI variables were measured before starting DMF treatment (baseline) and after 12 and 24 months of therapy in MS patients. Statistical significance was assessed before treatment and after 1 and 2 years in the whole sample and in the 3 subgroups of patients. p<0.05 was considered statistically significant.

†For numerical variables, p-values were calculated using the Wilcoxon signed rank test.

Values are the mean +/- SD.

‡For baseline ARR, only the previous year was considered.

§ Data not available for naïve MS patients at baseline, as most of them had a single magnetic resonance imaging (MRI).

¶ For percentages, odds ratio, confidence interval and p-values were calculated using the Chi-square test.

ARR, annualized relapse rate; EDSS, expanded disability status scale; GdE, gadolinium-enhanced T1 lesions; CDP, confirmed disease progression, NEDA-3, no evidence of disease activity 3

**SUPPLEMENTARY FIGURE S1. Correlations between absolute lymphocyte counts and endocannabinoids at baseline.** **A.** Lymphocyte counts at baseline and after 12 months of DMF therapy. Wilcoxon test was used to assess statistical significance. **B.** Correlation of 2-AG at baseline with lymphocyte counts at baseline. **C.** Correlation of AEA at baseline with lymphocyte counts at baseline. **D.** Correlation of OEA at baseline with lymphocyte counts at baseline. **E.** Correlation PEA at baseline with lymphocyte counts at baseline. B-E The Pearson correlation coefficient was calculated. \*\*\*\* $p < 0.0001$

**SUPPLEMENTARY FIGURE S2. Correlations between absolute lymphocyte counts and endocannabinoids at 12 months.** **A.** Correlation of 2-AG at 12 months with lymphocyte counts at 12 months. **B.** Correlation of AEA at 12 months with lymphocyte counts at 12 months. **C.** Correlation of OEA at 12 months with lymphocyte counts at 12 months. **D.** Correlation PEA at 12 months with lymphocyte counts at 12 months. **B-E** The Pearson correlation coefficient was calculated.

**A.**

**B.**

|      | Dim. 1    | Dim. 2    |
|------|-----------|-----------|
| 2-AG | 2,941636  | 75,096820 |
| AEA  | 17,653538 | 0,838203  |
| OEA  | 35,138957 | 22,155966 |
| PEA  | 44,265868 | 1,909011  |

**SUPPLEMENTARY FIGURE S3. PCA variables contribution.** **A.** Plot showing the relationship between the four ECBs. 2-AG, OEA and PEA are the variables more distant from the origin, meaning a high contribution to the PCA. 2-AG and PEA are positively correlated variables as they are grouped together in the same quadrant. Negatively correlated ECBs are positioned on opposite sides of the plot origin (opposed quadrants). **B.** Table showing the contribution of each ECB to the dimension 1 and 2 of the PCA. Variables that are correlated with Dim.1 and Dim.2 are the most important in explaining the variability in the data set.

**SUPPLEMENTARY FIGURE S4. Endocannabinoid levels at baseline in the subgroups of MS patients. (A-D) 2-AG, AEA, OEA and PEA baseline levels (in pmol/g of protein) in responders vs non-responders, women vs men and naïve vs previously treated patients. No differences were found for any of the ECBs in any of the subgroups. The Mann-Whitney test was used to compare differences between subgroups. Data are expressed as median with range. ns, not significant**
