

Behavioral parameters 24h post-FS

Figure S6. Parameters related to animal behavior in the open field. Rats were neuraminidase (NA) or saline (Sal) injected and, 3 months later, exposed to forced swimming (FS). After 24 hours, they performed an open field test. Parameters referring to supported rearing (A-B), unsupported rearing (C-D), freezing (E-F) and grooming (G-H) were measured. The histograms show the mean $\pm$ SD and the individual values of $n = 8-9$ animals per group. ** $p < 0.01$. p -values close to significance ($p < 0.15$) are also shown.
