

## Additional File 1. Supporting Figures and Tables

**Figure S1. Optimization of Chromatin fragmentation conditions.** Chromatin from *Cannabis sativa* was subjected to various sonication times and cycles under different cross-linking times to choose the most suitable strategy of obtaining chromatin fragments in the target 100 – 500 bp range. A final cross-linking time of 25 mins in combination with 2 cycles of 20 min sheering on high setting was selected for downstream immunoprecipitation.

**Table S1. Qubit dsDNA high sensitivity Assay results of immunoprecipitated chromatin from glandular trichomes, stalks, and vegetative leaves.** dsDNA content was estimated for each Immunoprecipitate to ensure a minimum sufficient mass of >10 pg was available for downstream library preparation using the Swift ACCEL-NGS® 2S Plus DNA library prep kit.

Sample ID	dsDNA concentration	
	Biological Replicate 1	Biological Replicate 2
INPUT control (Trichomes)	8.96 ng/μL	4.22 ng/μL
INPUT control (Stalks)	3.22 ng/μL	3.06 ng/μL
INPUT control (Vegetative leaves)	4.7 ng/μL	4.90 ng/μL
H2A.Z (Trichomes)	0.014 ng/μL	0.0112 ng/μL
H2A.Z (Stalks)	0.0062 ng/μL	0.0066 ng/μL
H2A.Z (Vegetative leaves)	0.0051 ng/μL	0.0104 ng/μL
H3K4me3 (Trichomes)	0.14 ng/μL	0.0504 ng/μL
H3K4me3 (Stalks)	0.0850 ng/μL	0.0804 ng/μL
H3K4me3 (Vegetative leaves)	0.0574 ng/μL	0.0240 ng/μL
H3K56ac (Trichomes)	0.112 ng/μL	0.0778 ng/μL
H3K56ac (Stalks)	0.0188 ng/μL	0.0162 ng/μL
H3K56ac (Vegetative leaves)	0.0148 ng/μL	0.0148 ng/μL
H3K27me3 (Trichomes)	0.0062 ng/μL	0.0069 ng/μL
H3K27me3 (Stalks)	0.0108 ng/μL	0.0106 ng/μL
H3K27me3 (Vegetative leaves)	0.0050 ng/μL	0.0071 ng/μL

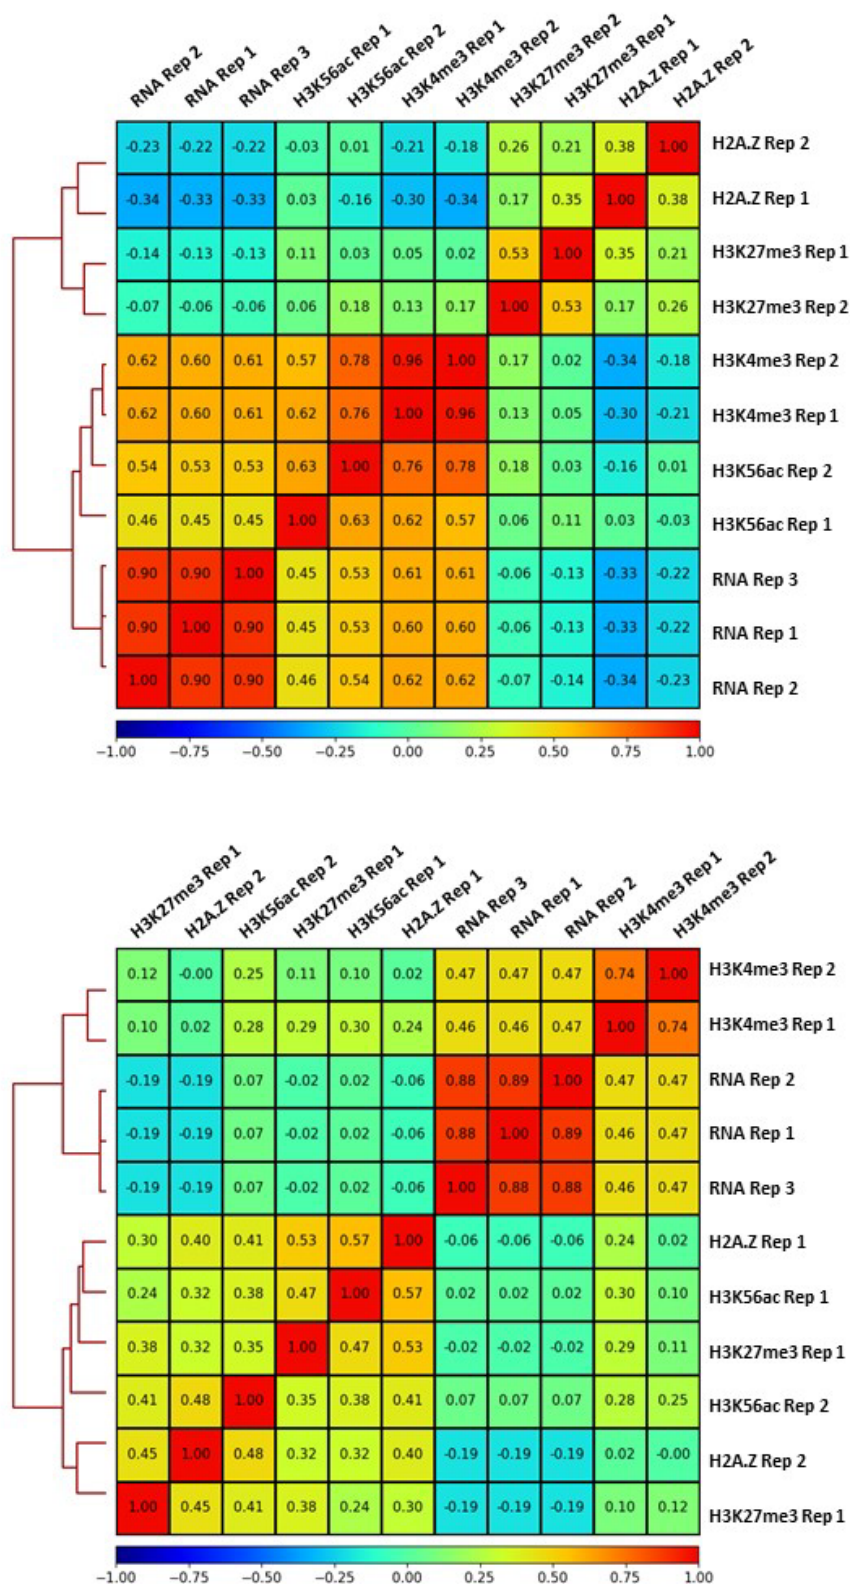

**Figure S3. Fingerprint plots of INPUT control and histone marks for each tissue type.** Fingerprint plots showing how the sequencing reads of each histone mark distribute across the *C. sativa* genome. Narrow peak data, H3K4me3 in this instance, tend toward acute right handed angles whereby the majority of reads are distributed in a small proportion of the genome and broad histone marks such as H3K56ac, H3K27me3 as well as the histone variant H2A.Z indicate a comparatively linear distribution throughout the genome similar to, yet discriminate from, the distribution of reads observed in the INPUT control

**Table S3b. HISAT2 Alignment mapping statistics of single end RNA sequencing data alignment to cs10 (GCF\_900626175.2).**

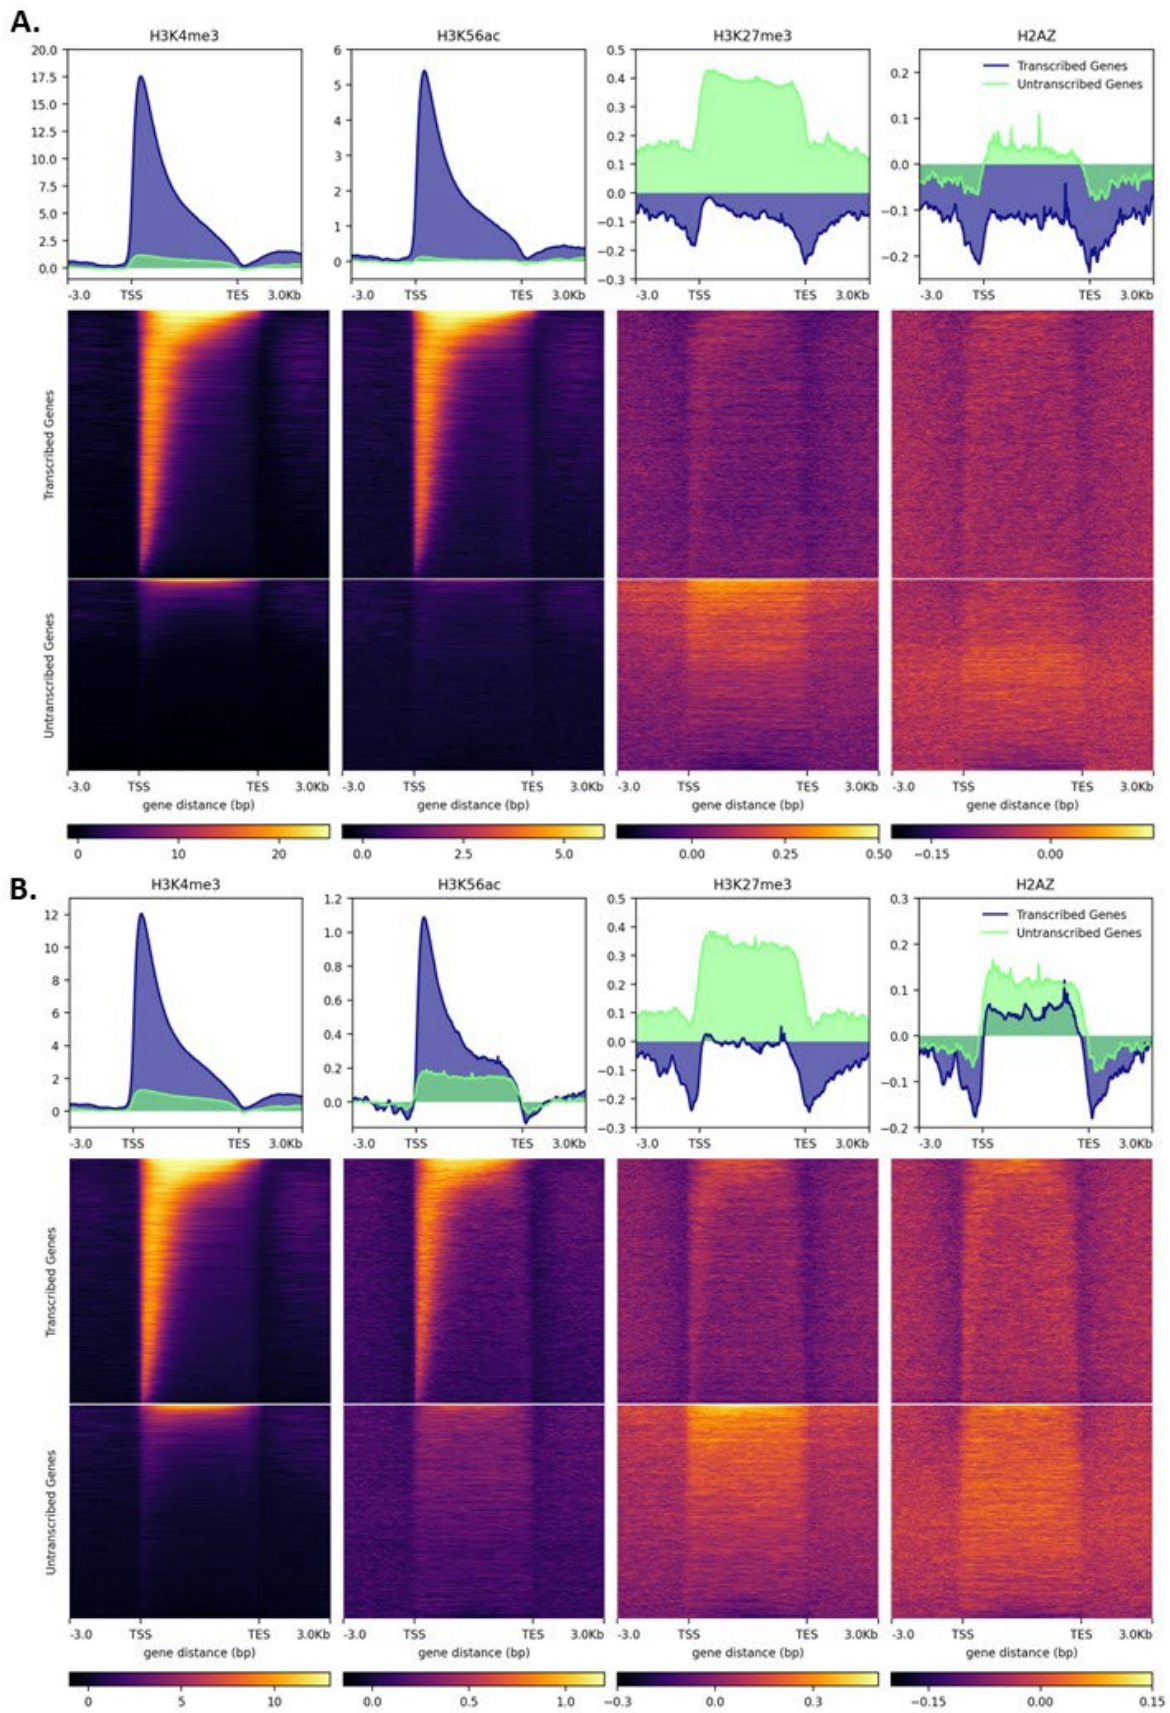

Sample	No. of raw reads	No. of mapped reads	%mapped reads
Leaf Rep. 1	23,473,287	21,208,394	90.35
Leaf Rep. 2	24,274,197	21,936,259	90.37
Leaf Rep. 3	23,267,045	20,984,219	90.19
Shoot Rep. 1	27,917,083	25,264,096	90.50
Shoot Rep. 2	19,416,942	17,485,856	90.05
Shoot Rep. 3	25,321,091	22,916,816	90.50
Trichomes Rep. 1	29,914,474	26,944,383	90.07
Trichomes Rep. 2	26,542,737	24,012,723	90.47
Trichomes Rep. 3	25,246,050	22,817,394	90.38

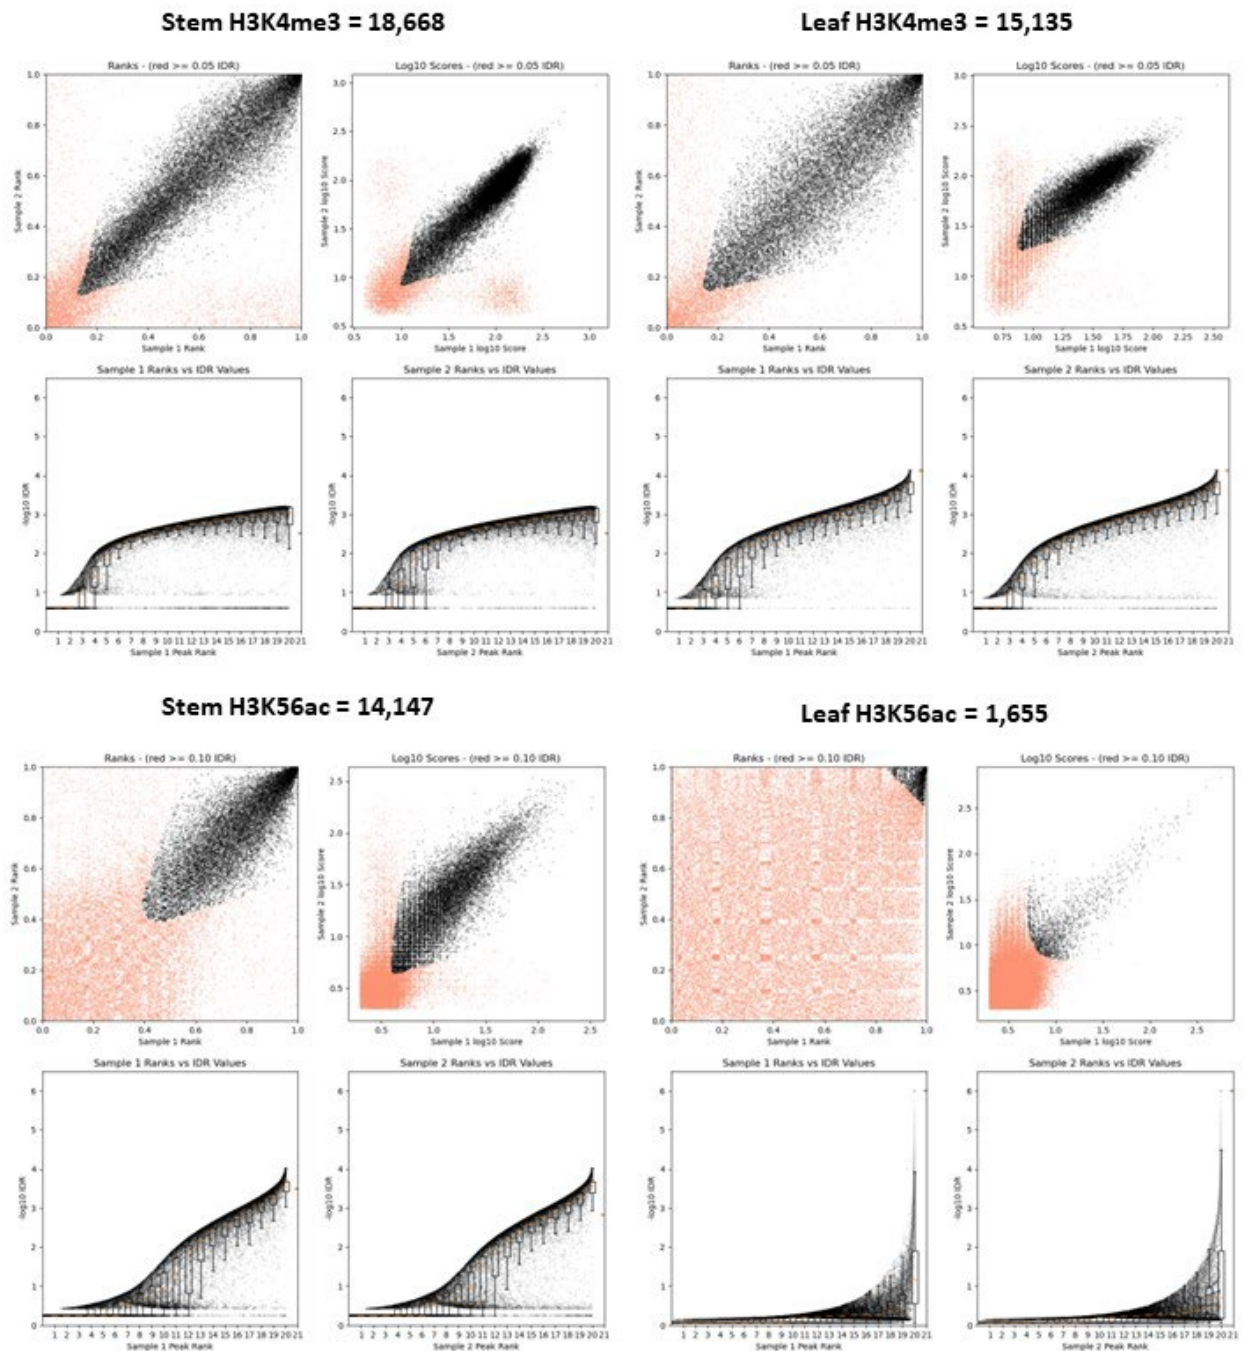

**Figure S4. Principal component analysis of RNA sequencing data from glandular trichomes, Stem (internode), and leaf tissues in triplicate. PCA indicates agreement between the biological replicates and distinction between the sample types. 66.5 % of the variance can be resolved by component 1.**

**Figure S5. Spearman correlation plots.** Data relationships between RNA seq and Histone marks were analysed by spearman correlation and plotted for stem (top) and leaf (bottom). These figures are the stem and leaf compliment of Fig. 1b.

**Figure S6. Integrated expression TSS plots of histone marks and variant.** Histone mark relationship and distribution in genes transcribed and untranscribed in that respective tissue. Stem (A) and leaf (B). Complement of trichomes Fig. 1e.

**Figure S7. Irreproducible discovery rate analysis of Stem and Leaf.** Application of the irreproducible discovery rate analysis method to determine consensus peaks between replicates for both narrow peak H3K4me3 and Mixed peak type H3K56ac replicates for both stem and leaf tissue. Consensus peaks identified are displayed above each panel of four. These are results are the stem and leaf compliment to trichomes found in Fig. 2 a & b.

**Figure S7d. Fisher exact test results H3K4me3 H3K27me3 Trichomes.** Null hypothesis is rejected, H3K4me3 and H3K27me3 peaks co-occur more than is expected by chance (two-tail p-value <  $1 \times 10^{-5}$ ). With at least 50% reciprocal overlap of peaks.

**Table S4. Transcribed and untranscribed genes in trichomes that contain histone marks.** Transcribed genes are enriched in histone marks H3K4me3 and H3K56ac while untranscribed genes are comparatively depleted. Untranscribed genes show greater enrichment of H3K27me3 and H2A.Z compared to transcribed genes

Genes	H3K4me3 trichome peaks	H3K56ac trichome peaks	H3K27me3 trichome peaks	H2A.Z trichome peaks
Transcribed in Trichomes (17,473)	14,611	10,829	1,395	377
Untranscribed in Trichomes (11,902)	2,009	471	2,366	1,148

**Figure S7e.** Spearman correlation plot of publicly available *Cannabis sativa* glandular trichome RNA isolates from 3 independent experiments show tissue specific correlation with the glandular trichome isolates from this study (MW6-15 Trichomes). Using trichome specific H3K4me3 demarcated genes MW6-15 trichome tissue from our research is shown to strongly correlate with RNA seq datasets from glandular trichome isolates from other studies while leaf and stem RNA datasets form a neat outgroup that do not correlate with any publicly available trichome datasets.

**Figure S8a. Ridge plot of glandular trichome enriched gene sets versus leaf.** Gene set enrichment analysis of glandular trichomes versus leaf molecular function gene ontologies conveyed by means of a ridge plot. Molecular function ontologies are listed and glandular trichome enriched ontologies are denoted by positive integers on the x-axis.

**Figure S8b. Ridge plot of glandular trichome enriched gene sets versus stem.** Gene set enrichment analysis of glandular trichomes versus stem molecular function gene ontologies conveyed by means of a ridge plot. Molecular function ontologies are listed and glandular trichome enriched ontologies are denoted by positive integers on the x-axis.
