

New Phytologist Supporting Information

Article title: **CIPK-B is essential for salt stress signalling in *Marchantia polymorpha***

Authors: Connor Tansley¹, James Houghton^{1*}, Althea M. E. Rose^{1*}, Bartosz Witek¹, Rocky D. Payet¹, Taoyang Wu², J. Benjamin Miller¹

Article acceptance date: 13 November 2022

The following Supporting Information is available for this article:

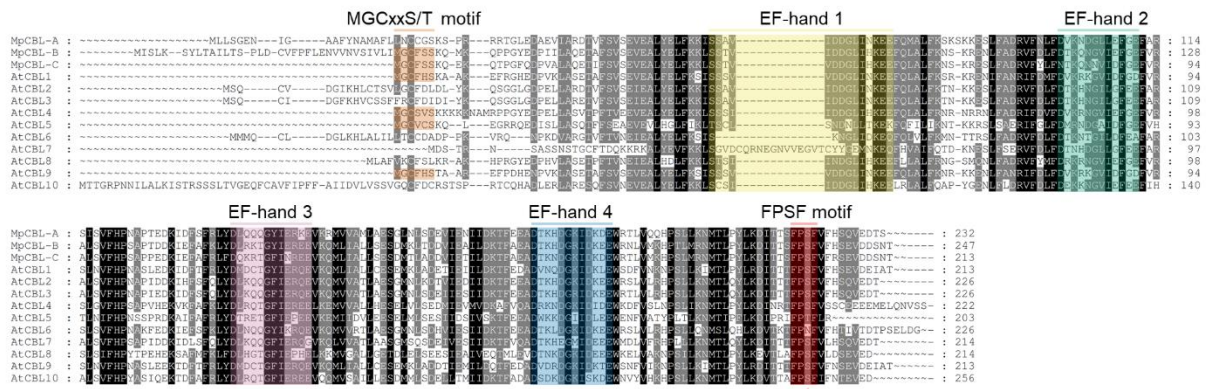

Fig. S1: Conservation of key domains in *Marchantia polymorpha* CBLs. Sequence alignment of CBL proteins from *A. thaliana* and *M. polymorpha*, with black/grey shading denoting the level of conservation. All three *M. polymorpha* CBLs have four conserved EF-hands (as indicated), including the first EF-hand containing a loop region of 14 amino acids. MpCBL-B/C (but MpCBL-A) contain the MGCxxS/T myristoylation and palmitoylation motif for localisation to the plasma membrane. All three *M. polymorpha* CBLs also have the conserved FPSF motif, including the conserved serine residue that can be regulated by phosphorylation (arrow head).

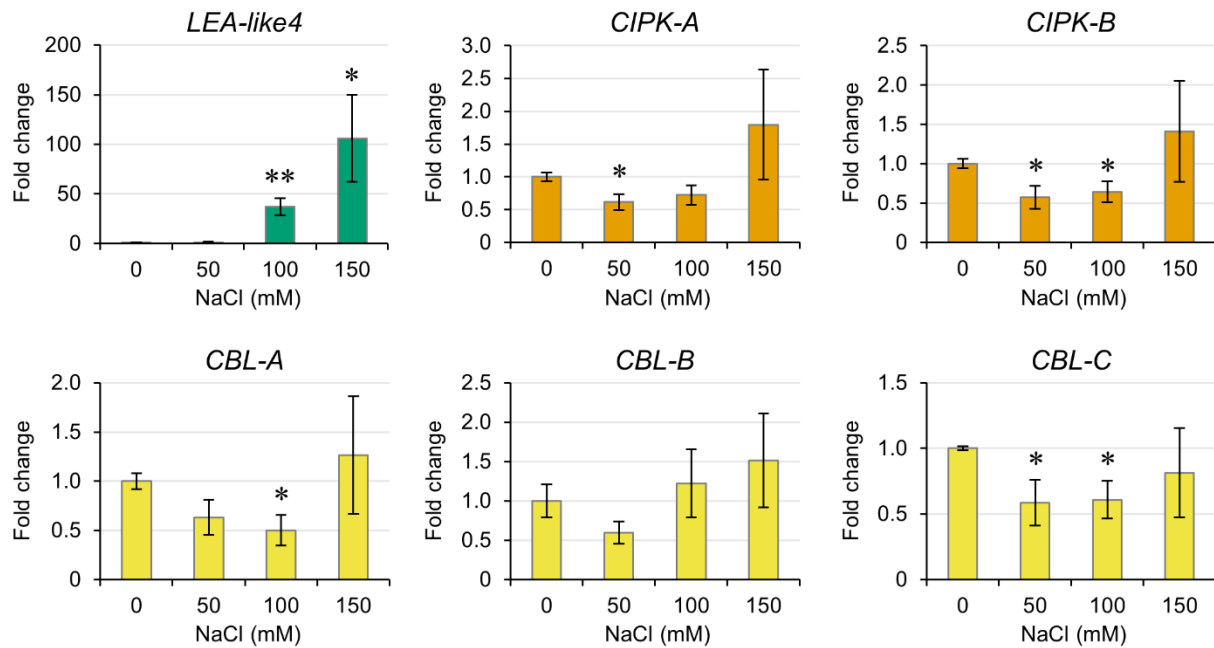

Fig. S3: Regulation of *CBL* and *CIPK* gene expression by salt stress in Tak-1 plants. Expression changes of the indicated genes were measured by RT-qPCR in thallus tissue of Tak-1 plants grown in the presence of the indicated concentrations of NaCl for 7 days. Data represent mean \pm one standard error from three independent biological replicates. Significance in a pairwise two-tailed t-test relative to 0 mM treatment is indicated at $p < 0.05$ (one star) or $p < 0.01$ (two stars).

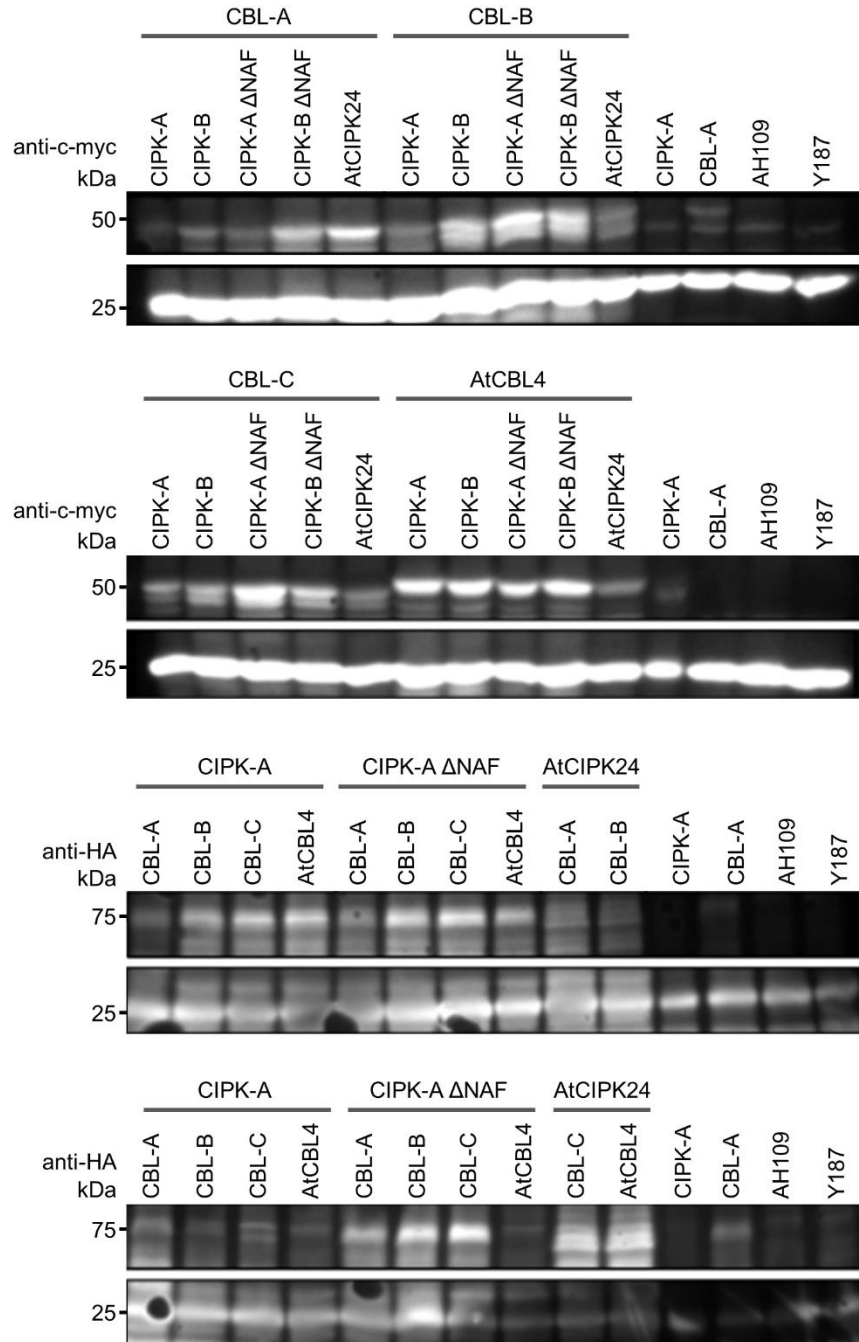

Fig. S4: Western blotting confirms expression of all *Marchantia polymorpha* CBLs and CIPKs in strains used for yeast two-hybrid assays. Western blotting using c-myc and HA antibodies identified proteins of the expected size for GAL4-BD-3xc-myc-CBLs and GAL4-AD-3xHA-CIPKs, respectively (upper panels). Expected sizes of the GAL4-BD-3xc-myc-CBLs are: 48.5 (MpCBL-A), 46.6 (MpCBL-B and MpCBL-C) and 47.8 kDa (AtCBL4). Expected sizes of the GAL4-AD-3xHA-CIPKs are: 69.7 (MpCIPK-A), 70.0 (MpCIPK-B), 67.1 (MpCIPK-A ΔNAF), 67.4 (MpCIPK-B ΔNAF) and 70.2 kDa (AtCIPK24). Lower panels correspond to loading control, using native yeast peroxidase (PRX1) activity as a proxy for total protein (expected size of 25 kDa).
